

FIT2092 Assignment 3

Meem it! - Useless web toy

Zac Lucarelli

Clearly state the web toy's target demographic and purpose

The toy's target demographic is people between the ages of 12-30 who might be interested in playing an online skill based game, or have played games similar to bop it before. Of course, people who enjoy memes will also like this toy and I see it as a way to kill time at the office or at home, since it can be kind of addicting trying to beat your highscore.

Provide instructions describing the interactions required and the expected result

The game will call out an instruction for you to do and you must press the right button before the timer reaches zero to get a point. The user can press buttons by rotating the toy with their mouse and pressing the mouse button. Upon pressing a button a sound will play and a different image will be displayed temporarily. Pressing the wrong button will cause a game over. The buttons and instructions are initially colour coded to help the player understand which buttons to press but the colored instructions will disappear after 7 successful button presses. The timer will keep speeding up the more points you get to increase the difficulty. The buttons are as follows, just in case:

Bork it - Red - The Dog

Doot it - Yellow - The skeleton

Punch it - Blue - The 3D roblox guy

Play it - Green - The bongos

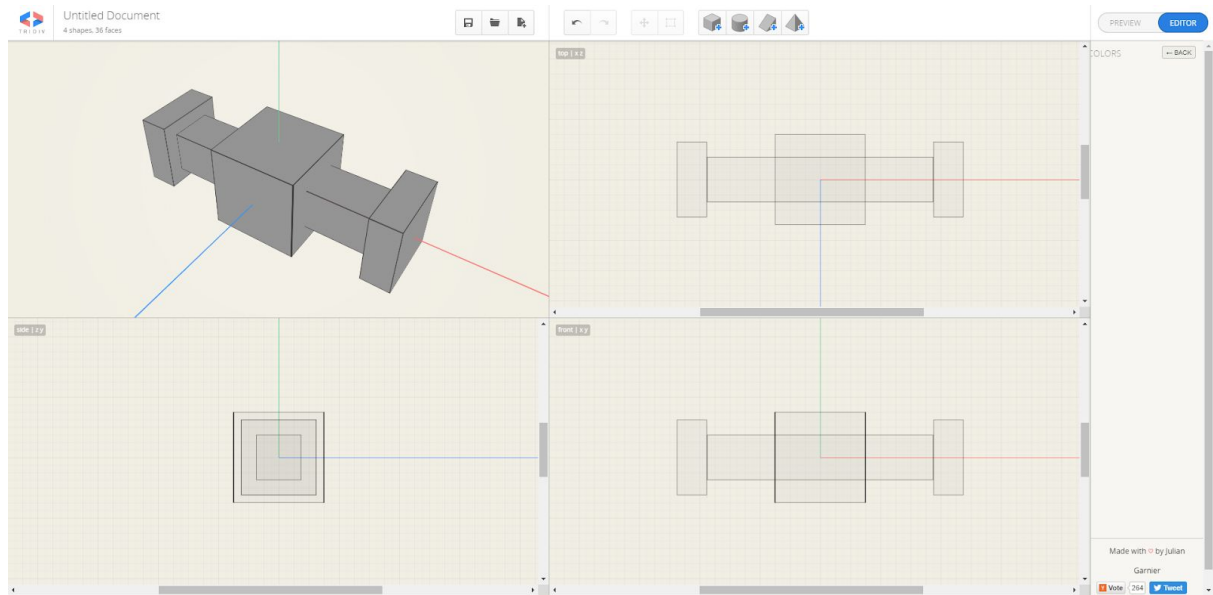

Examples of different resources that you have used in your research and development

I was originally inspired by the custom maps for the game Counter Strike that test your skill by having random targets appear in front of you so that you have to swing your mouse around. I really liked the idea of having to move your mouse around a lot to try hit a certain target, I then remembered playing bop-it as a kid and really enjoying it so I combined the two and added in memes since it'd be pretty boring otherwise.

[Tridiv](#) was also really helpful for the initial 3D layout and development since doing everything manually is a huge pain with 3D css and it let me prototype different designs really fast.

Visual records of the evolution of the project's design and implementation

Blocked out the basic shape in tri-div, an online 3D css editor

Color coded the faces for testing, as well as printing out the X and Y angle for debugging

play it

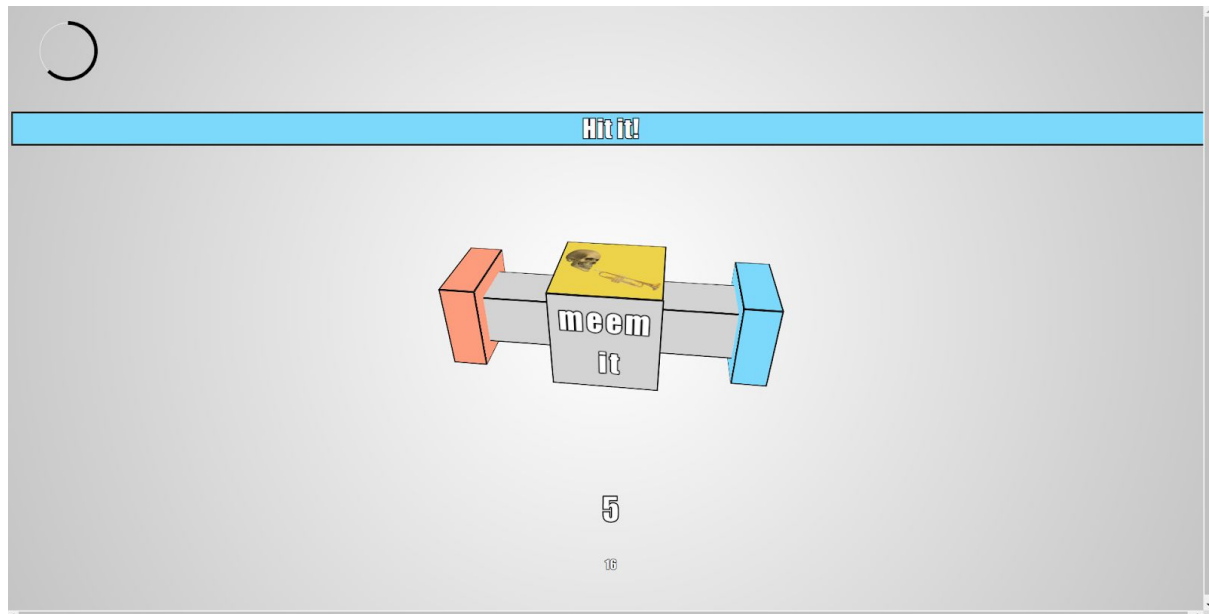

Clean up UI and add progress bar

Added in colours for instructions, I didn't originally intend for the line to extend across the screen but I really liked the look of it so I kept it.

Make progress bar smaller, add in impact font and outlines, change toy body colour to fit pastel colours more, increase box shadow on 3D edges, add radial gradient background to draw attention to toy.

References for any online tutorials used

I didn't follow any particular tutorial but I did borrow some common code from places like <http://www.vcarrer.com/2010/05/css-mini-reset.html> for the CSS reset and <https://stackoverflow.com/questions/3273552/html5-audio-looping> for the audio looping code. I also hate jquery so I had to look up a lot of common jquery functions in js on [MDN](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/jQuery) on [W3Schools](https://www.w3schools.com/jquery/). The loading bar was done with this [library](#).
